Pull Request or Patch supplied: Resolution:

Crashes QGIS or corrupts data: Copied to github as #: 29908

## **Description**

Hello,

I have 1.5gb on my C drive (yes, it is small, it's a SSD) and chose to install QGIS wholly on my E drive.

After a minute of installing, my computer crashed some applications, then terminated the install process and I found the cause was QGIS had dump over 1Gb of data on my C drive.

There really is no need to do this. When you select to install on a specific drive, it should do that.

Regardless, even if it needs to use C drive temporarily or permanently, it should be doing a disk size check to say whether it can install, rather than just crashing.

Now, of course, I need to figure out where all these files have been dumped because the installer has closed down as well.

thanks.
