The current way of creating and editing forms in QGIS is not ideal. It has all the great tools/features to built the forms but it can be improved to be a but more user-friendly. Here are some of the areas to improve it:

- Having a preview in the form designer
- Re-designing the current layout: it is confusing and all options are displayed. Some can be hidden away under advanced options.
- Logic based forms: allow attribute to be visible/editable based on the logic from other attributes
- Allow simple form design in Form view (when browsing data).
