QGIS Application - Bug report #2647 New Symbology: Attribute Classification Field not labeled

2010-04-13 02:59 AM - cmoe -

Status: Closed
Priority: Low
Assignee: nobody Category: Symbology

Affected QGIS version:

Operating System: All

Pull Request or Patch supplied:

Crashes QGIS or corrupts data:

Regression?: No

Easy fix?: No

Resolution: fixed

Copied to github as #: 12707

Description

In the old symbology, the attribute table shows a select box with the labels of the classified field, when Classification is chosed as edit widget.

In New Symbology the select box shows the value of the field and not the label that is given for this value.

The old behaviour is imho better, it allows both, to show the value directly or to show the label, so the new symbology should adapt it. Example: A table with a field 'type' has values 0,1,2. Classified as unique type over the field type gives three classses. Labeling them 0=Car,1=Bus,2=Bike gives in the select box edit widget of the old symobology the values Car, Bus, Bike, in the new symbology it gives 0,1,2. => the labels are much handier.

- Resolution set to fixed
- Status changed from Open to Closed

even worse label and value was mixed up. Fixed in (ouch commit still hangs...) (still does...) (wow this takes long) (should I do something?) (oh it's sending) (ah, siqg caught the commit message - but commit still hangs) (hooray finally) commit:b6bc442f (SVN r13307).
