Description

see http://lists.osgeo.org/pipermail/qgis-developer/2010-June/010346.html

it appears that 2 postgres layers with the same name, but if one of them has a where-clause applied get both the same FILTER statement in the mapfile

History

#1 - 2010-06-29 01:11 PM - Richard Duivenvoorde

- Resolution set to fixed

- Status changed from Open to Closed

fixed in commit:06f15b15 (SVN r13845)

it appears that it's not a typical postgres problem, but a problem of qgis layers having the same (display)name.

the names were used as keys in a layerlist for map-layer definitions, and used as (non unique!) layer names for the mapfile.

both bugs:

because the keys where not unique only the last layer definition was used;

and map files generated contained layers with non unique files

both fixed
