

QGIS Application - Bug report #3515

Projection issues

2011-02-20 10:51 PM - MsLiss -

Status: Closed	
Priority: Low	
Assignee: nobody -	
Category: Projection Support	
Affected QGIS version:	Regression?: No
Operating System: Debian	Easy fix?: No
Pull Request or Patch supplied:	Resolution: fixed
Crashes QGIS or corrupts data:	Copied to github as #: 13575
Description	
Hi there,	
I have a project with whole bunch of veg and cadastre data from QLD department Environment and Resurce Management. Using this data I've created a new layer with a couple of different classes of polygons - cool so far. But the problem is that I need to measure them now and the projection is just wacky - showing 0.4m when it's KMs. I've had a look at the metadata for everything and I can't see where the proplem is, exported this file to a fresh project, even to a ne machine, and smaple problem. And it seems to like flipping back to degrees too. Here is the projection info from the metatdata and the shapefile - what am I doing wrong? This is driving me bonkers! I need the areas in metre 2.	
<code>+proj=longlat +ellps=WGS84 +datum=WGS84 +no_defs</code>	

History

I noticed that you did not include Help.dbf, Help.prj, and Help.shx.

#2 - 2011-02-20 11:28 PM - MsLiss -

sorry, here ya

#3 - 2011-02-22 11:08 AM - MsLiss -

Hi there,

I've solved this problem by saving my source data with a different projection and devloping a new assessment layer. It would be great if this issue and solution was in the manual.
