| eVis throws error when trying create layer from SQL query. To reproduce: <ol style="list-style-type: none"><li>1. create connection to the database</li><li>2. create query "select * from species". Enter any layer name and don't change coordinate comboboxes</li><li>3. Get error "Layer is not valid The layer C:/Temp/qt_temp.JC4076?delimiter= &amp;xField=Lon&amp;yField=Lat is not a valid layer and can not be added to the map"</li></ol> |                                     |
| Tested with r15645 and r15659                                                                                                                                                                                                                                                                                                                                                                                                                        |                                     |
| I think this is because of latest changes in delimited text provider and here is patch to fix this issue.                                                                                                                                                                                                                                                                                                                                            |                                     |

### Associated revisions

#### Revision 48d7e85e - 2011-04-05 06:11 PM - Alexander Bruy

synchronize eVis with latest changes in delimited text provider (fix #3701)
