

QGIS Application - Bug report #4409

Weird behaviour on Mac OS

2011-10-19 04:31 AM - Dejan Gambin

Status: Closed	
Priority: Normal	
Assignee:	
Category: Build/Install	
Affected QGIS version:	Regression?: No
Operating System:	Easy fix?: No
Pull Request or Patch supplied:	Resolution: invalid
Crashes QGIS or corrupts data:	Copied to github as #: 14341

Description

Don't know if this is supposed to be so or I didn't set something correctly, but on my Mac OS (Snow Leopard), QGIS 1.7 or 1.8:

1. Menu bar is always hidden and can be displayed when moving the mouse cursor to the top of the screen
2. I don't have buttons for minimize/maximize the window. Also, I can't move QGIS window anywhere. So, can't move and/or resize it.

Did you installed QGIS with the packages available here?

http://www.qgis.org/wiki/Download#MacOS_X

I made an installation on Snow Leopard yesterday and I had no problems whatsoever. Please leave feedback.

Yes, I have recently installed 1.8 developer version from Kyngchaos and 1.7 also before that.

One possible related thing - I have external monitor attached to my Mac. But either when not attached, I have the same issue. Hidden menu, no red/orange/green buttons on the left upper side, no way to move the window

regards, dejan

Can you test on another machine?

Unfortunately I have only one Mac. Maybe I can ask someone to give it a try, but not sure :-)

That's full-screen mode. You must have hit apple-F at some point. Apple-F again should return you to windowed mode.

You are right thanks. It just didn't come to my mind, sorry.

Thanks again
