Description

I have been using the georeferencer plugin in v.0.7.4 and the 08 Preview2. I use a Helmert transformation, and am trying to get some 1:50 plans properly georeferenced. It would seem that the GRef plugin doesn't transform using floats - instead it rounds everything up to the nearest whole number. This results in the plans being georef'd to the wrong place.

Is it possible to change the precision so that my georeff'd tifs don't come out 40cms in the wrong place.

- Resolution set to fixed

- Status changed from Open to Closed

Fixed by , I hope. Using 5 decimals now. Please verify if it works.
