QGIS Application - Bug report #6686
Embedded layers from projects with groups misbehaving

2012-11-13 12:27 PM - John Tull

Status:	Closed			
Priority:	Normal			
Assignee:				
Category:	Project Loading/Saving			
Affected QGIS version:	master	**Regression?:**	No	
Operating System:		**Easy fix?:**	No	
Pull Request or Patch supplied:	No	**Resolution:**	not reproducable	
Crashes QGIS or corrupts data:	No	**Copied to github as #:**	15854	

Description

When I embed layers from an existing project, I get unusual and incorrect behavior when the embedded project file has layers in groups. Basically, grouped layers are added to the existing project correctly, but any ungrouped layers are placed within the last/lowest group from the original project file. I've attached a couple of screenshots to illustrate this. The first show the list of available groups and layers in the project being embedded. I've selected all and embedded them into the map legend/canvas. The second shot shows how these layers were handled with the top-most layer that was not grouped (Inventory) being placed into the "group1" group incorrectly. The group1 group is the "last" group in the embedded project.

If I save this project and reopen it, the groups and the layers correctly placed into their groups are shown, but the layer that was incorrectly placed into group1 is no longer in the project. This is shown in the third screenshot.

I can not reproduce using current master (commit:917dd055198f52b6288210d0a11f304aeacc2976). Can you test with master/latest nightly again?

If you still encounter the error, could you attach the project file you are embedding from?
