

QGIS Application - Bug report #7932

Identify Features freezes when a polygon has many interior rings

2013-05-28 06:33 PM - Joshua Brooks

Status: Closed	
Priority: Normal	
Assignee:	
Category: GUI	
Affected QGIS version: 1.8.0	Regression?: No
Operating System:	Easy fix?: No
Pull Request or Patch supplied:	Resolution: fixed/implemented
Crashes QGIS or corrupts data:	Copied to github as #: 16802
Description	
<p>Using the 'identify features' tool on a polygon with a large number of interior rings will cause QGIS to become very slow while drawing the red line indicating the selected feature and lock up if there are too many interior rings.</p> <p>More than 200 interior rings causes a noticeable delay, more than about 1000 will cause a lockup.</p> <p>This does not occur when using the 'Select Features' tool, I believe it has to do with how an identified feature is drawn.</p> <p>This is on a recent Linux X86-64 system using a PostGIS datasource, I've tested with a shapefile and had the same result.</p>
