

QGIS Application - Bug report #8021

Wrong PK selected: unclear error message

2013-06-07 01:14 AM - Paolo Cavallini

Status:	Closed	
Priority:	Normal	
Assignee:	Jürgen Fischer	
Category:	Data Provider/Oracle	
Affected QGIS version:	master	Regression?: No
Operating System:		Easy fix?: No
Pull Request or Patch supplied:		Resolution:
Crashes QGIS or corrupts data:		Copied to github as #: 16867
Description		
If a wrong PK is selected, the error message does not refer to the PK (I understand it is probably not possible to know what exactly is wrong), and the cursor indicates wrongly that something is being processed.

- Status changed from Open to Feedback

Please provide more information.

#2 - 2013-06-10 10:37 AM - Paolo Cavallini

I select a table, and a field that is in fact not unique, so not a good PK candidate. If I try to load the table in this way, I get an error that does not state something like "The field you selected is not a suitable primary key", so it is difficult for the user to understand what is wrong. Furthermore, the mouse cursor indicates some waiting state, but nothing is happening.

Um, I was asking for more information - not to (slightly) rephrase the old ;) Which error message do you get?

#4 - 2013-06-11 12:36 AM - Paolo Cavallini

No access to the Oracle instance, sorry.

- Status changed from Feedback to Closed

closing for the lack of feedback

#6 - 2015-01-11 12:40 AM - Paolo Cavallini

IMHO this should not be closed: the fix is easy, once the string is found, and the current situation is misleading for the user.
