Pull Request or Patch supplied:	No	**Resolution:**	
Easy fix?:	No	**Copied to github as #:** 16987	

Description

I have a **qgs** file which has a **maplayer** with a **datasource** with a wrong **user** field defined. Every time I open this **qgs** in QGIS, I am advised that it cannot log into the server for this layer and asks me to check the credentials. See the attached image.

I can enter new credentials and get the layer to load, but even if I re-save the project, the old, wrong username is still present in the **qgs** file. I can find no way to change the bad username without editing the **qgs** file or removing and re-adding the layer.

This happened because I put the wrong username in the into the PostGIS connection in the **Add PostGIS Table(s)** dialog. That dialog prompted me to enter the correct information when I connected, which I did. I didn't formally edit the connection information until after I had added the layer.

I am on master commit:a4fb5c7.
