Description

Hi !

Currently, to open a database in DBManager, you must first create a connection to it in the Browser.

Why not add a "project's databases" which would show all the connections used in the project's layers ? That would be very convenient. The browser could have the same.

This would be even more useful considering that Browser's connections are global and not project related, and that depending on the amount of projects you have, you may not want to display all of the connections of all of your projects.
