

QGIS Application - Bug report #9653

"Output layer" default for raster calculator

2014-02-25 08:13 AM - Jonathan Moules

Status: Closed	
Priority: Normal	
Assignee:	
Category: GUI	
Affected QGIS version: 2.2.0	Regression?: No
Operating System:	Easy fix?: No
Pull Request or Patch supplied:	Resolution: end of life
Crashes QGIS or corrupts data:	Copied to github as #: 18221

Description

Reproduce:

- 1) Load Raster Calculator, enter whatever formula.
- 2) Type desired filename (a.tif) into "Output layer".
- 3) Set to GeoTiff (probably happens with all types).
- 4) Press OK.

What will happen is that "a.tif" will be created in the QGIS/bin directory. Except that when I open the "output layer" dialog by clicking the elipses it shows me a different directory (one where I normally save my data). Surely it should place it into this directory; it makes no sense to ever put data into /bin

History

#1 - 2014-02-27 11:07 AM - Giovanni Manghi

- Target version set to Future Release - Lower Priority
- Category set to GUI

#2 - 2017-05-01 01:08 AM - Giovanni Manghi

- Easy fix? set to No
- Regression? set to No

#3 - 2019-03-09 03:11 PM - Giovanni Manghi

- Resolution set to end of life
- Status changed from Open to Closed

End of life notice: QGIS 2.18 LTR
