

QGIS Application - Feature request #9745

Value relation widget filter expression should have access to parent table attributes.

| Description | |
| <p>I was thinking that if the Value relation widget filter expression should have access to parent table attributes. So, if I have a "county" attribute in the parent table, I can create an expression for the Value relation widget that will filter all cities in that county. If the "county" attribute is null, I will get all cities.</p> | |

On a related note:

My mid-term goal are

- to move the "Value Relation" widget to make use of the information defined in the "relations"
- to include support for relations in expressions

so once that's done this should be possible
